

Phase 1: Data Loading and Data Acquisition

Detecting AI-Generated Arabic Text

Name: Samar Muflih Alharbi

ID: 4840144

Course: MSIS822

Class: F1

Dataset loading:

The dataset contains Arabic abstract in three subsets (by_polishing, from_title, from_title_and_content). Each record has 5 columns, each containing one text: the original human abstract and 4 AI versions generated by 4 models. Per the instructor's guidance, only the from_title_and_content subset is used.

Labeling:

The original wide format is not suitable for classification, so I reshaped it into long format: one text per row with a label (human = 0, AI = 1), and a source.

Data Quality:

After checking, no missing values or blanks detected. Only 3 duplicates texts were found (jais AI model). They will be removed in the data preprocessing phase.

Class distribution:

2574 human (label 0) vs 10296 AI (label 1). It shows imbalance between the 2 classes. This will be considered in later phases.
