

Phase 1: Data Loading and Data Acquisition

Detecting AI-Generated Arabic Text

Name: Samar Muflih Alharbi

ID: 4840144

Course: MSIS822

Class: F1

Dataset loading:

The dataset contains Arabic abstract in three subsets (by_polishing, from_title, from_title_and_content). Each record has 5 columns, each containing one text: the original human abstract and 4 AI versions generated by 4 models (allam, jais, llama, openai).

Reshaping:

The original wide format is not suitable for classification, so I reshaped it into long format: one text per row with a label (human = 0, AI = 1), a source, and a split. The result is 41940 rows.

Data Quality:

After checking, no missing values or blanks detected. 5415 duplicates rows found. Checking their source shows that 5396 of them are human abstracts which means they are shared across the 3 subsets

Class distribution:

8388 human (label 0) vs 33552 AI (label=1). It shows imbalance between the 2 classes. The real imbalance is even higher, since human abstracts are repeated across the 3 subsets
